In searching for these eskers, which, as observation shows, are in some cases but slightly buried, sometimes at no greater depth than 3 or 4 feet, the observer should select those points of the plain which are opposite the breaches or very low points in the frontal moraine. In practically all cases these breaches correspond to the point of emergence of a subglacial stream, and the appropriate place for the corresponding esker is on the line of that low depression in the morainal wall. In many cases, especially where the subglacial stream was large, the esker corresponding to a breach in the moraine is found to the northward, beyond the accumulation of...
