The first observation of April 8 was made by Mr. G. L. Brown at Stirling, with a loj-inch reflector. At ion the spot was seen about 300 east of the central meridian. The second observation is derived from measures of a sketch made by Mr. H. MacEwen at Glasgow, with a 5-inch refractor. As the two positions agree pretty well with each other, the mean of the two has been adopted in the calculations with weight 1. Arranging the different bright equatorial spots in order of increasing longitudes, we have the following results: --The first four spots evidently form a group, and combining the different values, the concluded period of rotation for Class C is ioh i2m 59s, 36o5-27. The period of the last spot is more than 13s shorter than this, so that we have here a similar difference to that existing between groups A and B...
